

# Oncology Notes

Leukemia		
	Acute Lymphoblastic Leukemia	Acute Myelocytic Leukemia
Cells of Origin	<ul style="list-style-type: none"> <li>- Predominant cells are of <i>Lymphoid origin</i></li> <li>- Most ALL originates in <i>B-Cell Precursors</i></li> <li>- <b>Philadelphia chromosome</b> t (9:22) or <i>BCR-ABL</i> genes</li> <li>* is almost always seen in <b>CML</b></li> <li>* BUT may also be seen in about 5% of ALL</li> </ul>	<ul style="list-style-type: none"> <li>- Predominant cells are of <i>myeloid origin</i></li> </ul>
Clinical Features	<p><b>Child from 2 – 10 years , with:</b></p> <ol style="list-style-type: none"> <li>1- Exertional Dyspnea / Pallor</li> <li>2- Easy bruising / purpura</li> <li>3- <b>Infections:</b> <ul style="list-style-type: none"> <li>- High grade fever</li> <li>- Otitis Media</li> <li>- Sore throat</li> </ul> </li> <li>4- <b>Lymphadenopathy</b></li> <li>5- <b>HepatoSplenomegaly</b></li> </ol>	<ul style="list-style-type: none"> <li>- <b>Both → Children &amp; Adult affected :</b></li> <li>1- Exertional Dyspnea / Pallor</li> <li>2- Easy bruising / purpura</li> <li>3- <b>Infections:</b> <ul style="list-style-type: none"> <li>- High grade fever</li> <li>- Otitis Media</li> <li>- Sore throat</li> </ul> </li> <li>5- <b>HepatoSplenomegaly</b></li> <li>6- Mucosal Bleeding &amp; Ocular hemorrhage</li> </ul>
Lab	- Anemia - Thrombocytopenia - Neutropenia	- Anemia - Thrombocytopenia - Neutropenia
Peripheral Smear	<ul style="list-style-type: none"> <li>- <b>Lymphoblasts</b> (Large nuclei &amp; Prominent nucleoli)</li> </ul> 	<ol style="list-style-type: none"> <li>1- Large myeloblasts with <b>notched nuclei</b> .</li> <li>2- and <b>Auer Rods</b> (<i>specific for AML</i>)</li> </ol> 
Bone Marrow	Diagnostic: <b>&gt;25% lymphoblasts</b>	
Histochemical Staining	<p><b>Positive "Periodic Acid Schiff (PAS)" reaction</b></p> <p><i>Lymphoblasts contain cytoplasmic "PAS" materials</i> <i>BUT lack "peroxidase positive" granules</i></p>	<p>Myeloblasts has : <b>"peroxidase positive" granules</b></p> <p>→ staining with <b>myeloperoxidase</b></p>
ImmunoStaining	<b>For terminal deoxynucleotidyltransferase (TdT) is Positive</b> (TdT expressed only by Pre-T/Pre-B Lymphoblasts)	

Lymphoma		
	Hodgkin Lymphoma	Non-Hodgkin Lymphoma
Cells of origin	<b>B cells</b>	<ol style="list-style-type: none"> <li>1- Lymphocytes (<b>most commonly B cells</b>) or</li> <li>2- Natural killer cells</li> </ol>
Classification (low to higher grade)	<ol style="list-style-type: none"> <li>1- <b>Nodular sclerosis</b> (<b>most common</b>, women = men, fibrosis of lymph nodes)</li> <li>2- <b>Mixed cellularity</b></li> <li>3- <b>Lymphocyte Rich</b> (rare, <b>best</b> prognosis)</li> <li>4- <b>Lymphocyte-depleted</b> (very rare, <b>worst</b> prognosis)</li> </ol>	<p><b>Many types, Common variants include:</b></p> <ol style="list-style-type: none"> <li>1- Diffuse large B cell (<b>most common</b>)</li> <li>2- Follicular small cell (<b>B cells, t[14;18]</b>)</li> <li>3- Small lymphocytic (<b>same disease as CLL</b>)</li> <li>4- <b>Burkitt ( EBV related, t[8;14], "starry sky" pattern)</b></li> <li>5- Peripheral (<b>T cells</b>)</li> </ol>
Risk factors, patient population	<ul style="list-style-type: none"> <li>- <b>Bimodal age distribution</b> (peaks at 20 and 65 yr of age)</li> <li>- <b>men &gt; women</b> (except for nodular sclerosis subtype)</li> </ul>	<ol style="list-style-type: none"> <li>1- EBV → <b>Burkitt Lymphoma</b> : <ul style="list-style-type: none"> <li>- Most patients present with either: <ol style="list-style-type: none"> <li>1- Mass involving Mandible or</li> <li>2- Abdominal Viscera</li> </ol> </li> </ul> </li> <li>2- HIV</li> <li>3- Congenital immunodeficiencies</li> <li>4- Rheumatic disease</li> </ol>
Clinical Features	<ol style="list-style-type: none"> <li>1- Painless lymphadenopathy (<b>neck</b>)</li> <li>2- <b>Fever , night sweats , weight loss,</b></li> <li>3- Pruritus,</li> <li>4- Hepatosplenomegaly</li> </ol>	<ol style="list-style-type: none"> <li>1- Painless lymphadenopathy (<b>generalized</b>)</li> <li>2- <b>weight loss, fever, night sweats</b></li> </ol>
Labs	<p>LN biopsy shows : <b>Reed-Sternberg cells</b> (resemble owls' eyes)</p> 	<p><b>Lymph node or bone marrow biopsy shows :</b></p> <p><b>Lymphocyte proliferation</b></p> <p>(cleaved cells seen in follicular small cell variant)</p>
Treatment	<b>Radiation, chemotherapy</b>	<b>Palliative radiation, chemotherapy</b>
Prognosis	<b>Good</b> , 80% cure rate unless far progressed	<b>Poor</b> (months for aggressive types, years for less aggressive variants), worsens with increasing age

# Brain Tumors

- In pediatrics, **CNS tumors** are the **most common solid tumors** and the **second most common malignancies** (after leukemias).
- **Astrocytomas** are the **most common histologic type** for both supratentorial & infratentorial groups

- **Anterior vermis lesions** are due to degeneration from **Alcohol abuse** and present with **GAIT ATAXIA**
- **Posterior vermis lesions** are due to **Medulloblastoma or Ependymoma** and present with **TRUNCAL ATAXIA**

Age	Location <small>15% arise in midline</small>	Types
0-1 year	Supra-tentorial (25%)	1- Choroid plexus tumor 2- Teratoma
2-10 year	Infratentorial (60%)	1- Juvenile pilocytic astrocytoma 2- Medulloblastoma
>10 years	Supratentorial	1- Diffuse astrocytoma

<b>Medulloblastoma</b>	<ul style="list-style-type: none"> <li>• <b>Embryonal tumor</b> arising from <b>external granular layer of cerebellum in cerebellar vermis (esp posterior)</b></li> <li>• <b>Site:</b> Most common in <b>Posterior vermis in midline</b> (2<sup>nd</sup> most common tumor of posterior fossa in children)</li> <li>• May <b>obstruct 4th ventricle</b> giving <b>hydrocephalus</b></li> <li>• <b>Presents with:</b> <b>1- Unbalanced gait</b> <b>2- Truncal ataxia</b> <b>3- Horizontal nystagmus</b> (Posterior vermis syndrome)</li> <li>• <b>Treatment:</b> with <b>Radiation &amp; chemotherapy</b> (it is highly aggressive but responds to chemo)                             <ul style="list-style-type: none"> <li>- Can give drop metastasis</li> <li>- Highly radiosensitive</li> </ul> </li> </ul>				
<b>Craniopharyngiomas</b> <small>Cystic Calcified parasellar lesion on MRI</small>	<ul style="list-style-type: none"> <li>• Craniopharyngiomas are derived from <b>epithelial remnants of Rathke's pouch</b></li> <li>• It is not a true pituitary tumor, and is characterized by <b>nests of squamous cells in a loose stroma</b>, resembling the <b>appearance of embryonic tooth bud enamel</b></li> <li>• <b>A young boy</b> with symptoms of :                             <ol style="list-style-type: none"> <li>1- <b>Increased intra-cranial pressure</b> (e.g. .. headaches vomiting)</li> <li>2- <b>Bi-temporal hemianopsia</b> (because its location is suprasellar and inferior to the optic chiasm)</li> <li>3- <b>Calcified lesion above the sella</b> → has a <b>craniopharyngioma</b> until proven otherwise.</li> </ol> </li> <li>• <b>Associations :</b> <ol style="list-style-type: none"> <li>1- <b>Endocrine symptoms</b> such as <b>diabetes insipidus</b>, and <b>growth failure</b> associated with either <b>hypothyroidism</b> or <b>growth hormone deficiency</b>.</li> </ol> </li> <li>• <b>Diagnosis :</b> Usually made by <b>(CT)</b> or <b>(MR)</b> imaging:                             <ul style="list-style-type: none"> <li>- Presence of a <b>Cystic Calcified parasellar lesion on MRI</b> is almost diagnostic of craniopharyngioma.</li> </ul> </li> <li>• <b>Treatment :</b> Surgical removal is the treatment of choice.</li> </ul>				
<b>Pinealoma</b>	<ul style="list-style-type: none"> <li>• Develops in the <b>dorsal aspect of the midbrain</b></li> <li>• <b>Symptoms</b> consist of :                             <table style="width: 100%; border: none;"> <tr> <td style="width: 50%;">1- <b>Endocrine syndrome</b></td> <td style="width: 50%;">2- <b>Intracranial hypertension</b></td> </tr> <tr> <td>3- <b>Parinaud's sign</b> (paralysis of vertical gaze)</td> <td>4- <b>Collier's sign</b> (retraction of eyelid).</td> </tr> </table> </li> </ul>	1- <b>Endocrine syndrome</b>	2- <b>Intracranial hypertension</b>	3- <b>Parinaud's sign</b> (paralysis of vertical gaze)	4- <b>Collier's sign</b> (retraction of eyelid).
1- <b>Endocrine syndrome</b>	2- <b>Intracranial hypertension</b>				
3- <b>Parinaud's sign</b> (paralysis of vertical gaze)	4- <b>Collier's sign</b> (retraction of eyelid).				

## Painless abdominal mass in a child <5 years

Wilms Tumor (Nephroblastoma)	Neuroblastoma
Arise from <b>Kidney (metanephros)</b>	Arise from <b>Neural crest cells</b> of <b>sympathetic nervous system</b> (similar to pheochromocytoma but fewer cardiac findings)
<ul style="list-style-type: none"> <li>- Most common primary renal neoplasm of childhood</li> <li>- Usually diagnosed between the <b>ages of 2 – 5 years</b></li> </ul>	<ul style="list-style-type: none"> <li>- Most common extracranial solid cancer in childhood and the most common cancer in <b>infancy &lt;1 year</b></li> </ul>
<ol style="list-style-type: none"> <li>1- Most cases are sporadic</li> <li>2- Mutations of <b>WT1 gene on chromosome 11p13</b></li> </ol>	<b>N-myc proto-oncogene</b>
<ul style="list-style-type: none"> <li>- <b>Asymptomatic non tender smooth abdominal mass</b> ( in 80% )</li> <li>- <b>The mass bilateral</b> ( in 10% of cases )</li> </ul>	Most common site: <b>Adrenal, Retroperitoneal ganglion</b> <b>Non tender abdominal, thoracic, cervical mass</b>
<b>Symptoms:</b> <ol style="list-style-type: none"> <li>1- Hypertension</li> <li>2- Hematuria</li> <li>3- Abdominal Pain &amp; vomiting</li> <li>4- Lung metastasis (in few cases)</li> </ol>	<b>Symptoms:</b> <ol style="list-style-type: none"> <li>1- Can cause hypertension</li> <li>2- <b>Mostly metastatic at the time of diagnosis:</b> long bones, skull, bone marrow, liver, lymph nodes</li> </ol>
<b>Kidneys are separately palpable from tumor</b>	<b>Kidneys are non-palpable</b>
<b>Don't cross the midline</b>	<b>Cross the midline</b>
<b>Associated with:</b>	<b>Associated with:</b>
<ol style="list-style-type: none"> <li>1- <b>WAGR Syndrome: Wilms Aniridia GU anomalies Mental Retardation</b></li> <li>2- <b>Beckwith widemann syndrome</b></li> <li>3- <b>Denys-Drash syndromes</b></li> <li>4- H/O Horseshoe kidney</li> </ol>	<ol style="list-style-type: none"> <li>1- <b>Hypsarrhythmia</b> (dancing eyes)</li> <li>2- <b>Opsoclonous</b> (dancing feet)</li> <li>3- <b>Horner syndrome</b></li> </ol>
<b>Best initial test</b> = USG	<b>Elevated 24 hours urinary catecholamines</b> (VMA & HVA)
<b>Most accurate</b> = CECT	<b>Calcifications on imaging</b>
<b>Treatment:</b> is <b>nephrectomy</b> . If treated in the early stage, majority of the patients have a long-term survival.
